SeisData

A custom structure designed to contain the minimum necessary information
for processing univariate geophysical data.

SeisChannel

A single channel designed to contain the minimum necessary information
for processing univariate geophysical data.

Fields
========

Field	Description
:n	Number of channels [^1]
:c	TCP connections feeding data to this object [^1]
:id	Channel id. Uses NET.STA.LOC.CHAN format when possible
:name	Freeform channel name
:loc	Location (position) vector; any subtype of InstrumentPosition
:fs	Sampling frequency in Hz; fs=0.0 for irregularly-sampled data.
:gain	Scalar gain
:resp	Instrument response; any subtype of InstrumentResponse
:units	String describing data units. UCUM standards are assumed.
:src	Freeform string describing data source.
:misc	Dictionary for non-critical information.
:notes	Timestamped notes; includes automatically-logged info.
:t	Matrix of time gaps in integer μs, formatted [Sample# Length]
:x	Time-series data

[1] Types: A = Array, B = Boolean, C = Char, DT = DateTime, F = Float, I = Integer, S = String, U8 = Unsigned 8-bit integer (UInt8)

[2] search range is always ot-|evw[1]| ≤ t ≤ ot+|evw[2]|

[3] nev=0 returns all events in the query

[4] String is passed as-is, e.g. szsrecs=true&repo=realtime for FDSN. String should not begin with an ampersand.

[5] Comma-separated String, like P, pP; use ttall for all phases

[6] Specify region [center_lat, center_lon, min_radius, max_radius, dep_min, dep_max], with lat, lon, and radius in decimal degrees (ř) and depth in km with + = down. Depths are only used for earthquake searches.

[7] Specify region [lat_min, lat_max, lon_min, lon_max, dep_min, dep_max], with lat, lon in decimal degrees (ř) and depth in km with + = down. Depths are only used for earthquake searches.

[8] If w=true, a file name is automatically generated from the request parameters, in addition to parsing data to a SeisData structure. Files are created from the raw download even if data processing fails, in contrast to get_data(wsac=true).
